The SCT2600 regulates the internal reference voltage at 0.765V with 2.5% tolerance over the operating temperature and voltage range. The output voltage is set by a resistor divider from th

---

the junction temperature exceeds 173 °C, the internal thermal sensor stops power MOSFETs switching. When the junction temperature exceeds 173 °C, the internal thermal sensor stops power MOSFETs switching. When the junction temperature exceeds 173 °C, the internal thermal sensor stops power MOSFETs switching.

Figure 10. SCT2600 Design Example, 5V Output with Programmable UVLO

Input Voltage	24V Normal
Output Voltage	5V
Maximum Output Current	0.6A
Switching Frequency	2.1 MHz
Output voltage ripple (peak to peak)	10mV
Transient Response 0.15A to 0.45A load step	Vout = 180mV
Start Input Voltage (rising VIN)	8V
Stop Input Voltage (falling VIN)	7V

---

The output voltage is set by an external resistor divider R5 and R6 in typical application schematic. Recommended R6 resistance is 10.2K . Use equation 5 to calculate R5.

Table

$$\text{---} \quad (5)$$

where:

$V_{REF}$  is the feedback reference voltage, typical 0.765V

---

(9)

Where

- $L_{MIN}$  is the minimum inductance required
- $f_{sw}$  is the switching frequency
- $V_{OUT}$  is the output voltage
- $V_{IN(max)}$  is the maximum input voltage
- $I_{OUT(max)}$  is the maximum DC load current
- LIR is coefficient of  $I_{LPP}$  to  $I_{OUT}$

The total current flowing through the inductor is the inductor ripple current plus the output current. When selecting an inductor, choose its rated current especially the saturation current larger than its peak operation current and RMS current also not be exceeded. Therefore, the peak switching current of inductor,  $I_{LPEAK}$  and  $I_{LRMS}$  can be calculated as in equation 10 and equation 11.

(10)

(11)

Where

- $I_{LPEAK}$  is the inductor peak current
- $I_{OUT}$  is the DC load current
- $I_{LPP}$  is the inductor peak-to-peak current
- $I_{LRMS}$  is the inductor RMS current

In overloading or load transient conditions, the inductor peak current can increase up to the switch current limit of the device which is typically 1.6A. The most conservative approach is to choose an inductor with a saturation current rating greater than 1.6A. Because of the maximum  $I_{LPEAK}$  limited by device, the maximum output current that the SCT2600 can deliver also depends on the inductor current ripple. Thus, the maximum desired output current also affects the selection of inductance. The smaller inductor results in larger inductor current ripple leading to a lower maximum output current.

The SCT2600 requires an external catch diode between the SW pin and GND. The selected diode must have a reverse voltage rating equal to or greater than  $V_{IN(max)}$ . The peak current rating of the diode must be greater than the maximum inductor current. Schottky diodes are typically a good choice for the catch diode due to their low forward voltage. The lower the forward voltage of the diode, the higher the efficiency of the regulator.

Typically, diodes with higher voltage and current ratings have higher forward voltages. A diode with a minimum of 60-V reverse voltage is preferred to allow input voltage transients up to the rated voltage of the SCT2600.

characteristic voltage and bandwidth at 100 kHz. At 100 kHz, the forward voltage of the diode, the

---

The B360A-13-F diode has a junction capacitance of 200 pF. Using Equation 12, the total loss in the diode at the maximum input voltage is 0.39 W.

If the power supply spends a significant amount of time at light load currents or in sleep mode, consider using a diode which has a low leakage current and slightly higher forward voltage drop.

---

capacitor like ceramic capacitor. For ceramic capacitors, the capacitance dominates the output ripple. For simplification, the output voltage ripple can be estimated by Equation 16 desired.

---

The maximum IC junction temperature should be restricted to 125°C under normal operating conditions. Calculate the maximum allowable dissipation,  $P_{D(max)}$ , and keep the actual power dissipation less than or equal to  $P_{D(max)}$ . The maximum-power-dissipation limit is determined using Equation 14.
